## Methodology

This Times-Picayune/Lucid 2016 Battleground State poll of Ohio is among a demographically representative sample of at 1,304 adults who report both being registered to vote and likely to vote this November. Survey was conducted between October 7 and October 10, 2016.

Respondents are selected from among the nearly one million survey-takers who pass through Lucid's technology each day. Results are post-stratified using simple survey weights to reflect Ohio's demographics according to the US Census.

All respondents on the Lucid platform have volunteered to participate in a survey and were not chosen for participation in the Ohio poll through random selection. No sampling error can therefore be calculated.

Unlike reader polls that survey respondents who happen to be reading a specific article or website, Lucid's platform finds survey-takers through a marketplace that diversifies where respondents come from and blinds the subject matter of the survey that each respondent will take. Lucid's findings also takes into account each survey-taker's demographics so that the model is representative of the population at-large.

Online polls remain relatively unproven in their application to political projections though they hold great potential as telephone polls conducted through probability sampling rise in cost and representivity becomes more challenging to achieve. This is Lucid's first attempt to leverage its platform for such a purpose. Analysts of these results should bear that in mind. Constructive feedback is always welcome and appreciated.
